OpenBASIC MKEYED Conversion Help

BASIS has always focused on delivering robust, competitive functionality within its products, but that functionality is most easily delivered to code written in our language. We spend a great deal of time and effort to ease the transition of an application from another language into ours.

It is in this vein that we have purchased a set of utility programs that make the conversion from OpenBASIC applications to BBX® and PRO/5® much easier. In addition to downloading them here, you can also find these programs and the respective documentation included in our "convert" directory that comes free with all BASIS products. It is also included with our utilities programs downloadable from our website.
